

### **AMENDMENTS TO THE CLAIMS**

The following listing of claims will replace all prior versions, and listing of claims in the application:

#### **LISTING OF CLAIMS:**

1. (Currently amended) A pixel structure for an LCoS display to reflect an incident light at an incident angle to an output light at an output angle, the pixel structure comprising:

a glass plate for refracting the incident light to a first light at a first angle;

~~an pixel~~ electrode under the glass plate;

an insulator formed on the ~~pixel~~ electrode;

a plurality of reflectors on the insulator for reflecting the first light to a second light at a second angle to be further refracted by the glass plate to the output light;

a passivation on the plurality of reflectors and the insulator; and

a transparent conductor on the passivation.

2. (Withdrawn) The pixel structure of claim 1, wherein the transparent conductor is electrically connected to the ~~pixel~~ electrode by the plurality of reflectors.

3. (Currently amended) The pixel structure of claim 1, wherein the transparent conductor is directly connected to the ~~pixel~~ electrode.
4. (Original) The pixel structure of claim 1, wherein each of the plurality of reflectors is oblique at a third angle.
5. (Original) The pixel structure of claim 4, wherein each of the plurality of reflectors comprises a high reflective metal.
6. (Withdrawn) The pixel structure of claim 4, wherein each of the plurality of reflectors comprises a high reflective multilayer coating.
7. (Original) The pixel structure of claim 4, wherein the plurality of oblique reflectors comprises:
- a first group of reflectors each having a reflective surface with a third angle to the insulator for reflecting a first wavelength component of the first light;
  - a second group of reflectors each having a reflective surface with a fourth angle to the insulator for reflecting a second wavelength component of the first light; and

a third group of reflectors each having a reflective surface with a fifth angle to the insulator for reflecting a third wavelength component of the first light.

8. (Withdrawn) The pixel structure of claim 1, wherein each of the plurality of reflectors has an optical grating.

9. (Withdrawn) The pixel structure of claim 8, wherein the optical grating comprises one or more metal layers in stack.

10. (Withdrawn) The pixel structure of claim 8, wherein the optical grating comprises a high reflective multilayer coating.

11. (Withdrawn) The pixel structure of claim 8, wherein the plurality of reflectors comprises:

a first group of the optical gratings having a first period for reflecting a first wavelength component of the first light;  
a second group of the optical gratings having a second period for reflecting a second wavelength component of the first light; and  
a third group of the optical gratings having a third period for reflecting a third wavelength component of the first light.

12. (Withdrawn) The pixel structure of claim 1, wherein each of the plurality of reflectors comprises:

- a planar reflective surface; and
- a transparent element on the planar reflective surface for refracting the first light to be vertically incident on the planar reflective surface.

13. (Withdrawn) The pixel structure of claim 12, wherein the planar reflective surface comprises a high reflective metal.

14. (Withdrawn) The pixel structure of claim 12, wherein the transparent element comprises one or more microprisms.

15. (Withdrawn) The pixel structure of claim 12, wherein the plurality of reflectors comprises:

- a first group of the transparent elements for refracting a first wavelength component of the first light;
- a second group of the transparent elements for refracting a second wavelength component of the first light; and
- a third group of the transparent elements for refracting a third wavelength component of the first light.

16. (Cancelled).

17. (Currently amended) A The method of claim 16, wherein the step of reflecting the first light comprises the steps of: for an LCoS display to reflect an incident light at an incident angle to an output light at an output angle, the method comprising the steps of:

refracting the incident light to a first light at a first angle;

reflecting the first light to a second light at a second angle by a

plurality of oblique reflectors, the step of reflecting the first light

including the steps of:

reflecting a first wavelength component of the first light  
by a first group of the reflectors each having a reflective  
surface oblique at a third angle;

reflecting a second wavelength component of the first  
light by a second group of the reflectors each having a  
reflective surface oblique at a fourth angle; and

reflecting a third wavelength component of the first light  
by a third group of the reflectors each having a reflective  
surface oblique at a fifth angle; and,

refracting the second light to the output light.

18. (Original) The method of claim 16, wherein the step of reflecting the first light comprises diffracting the first light.

19. - 23. (Cancelled).
